State population forecast by age and sex: 2020-50

Part 1: Discussion of forecast model assumptions

The Office of Financial Management's (OFM) state population forecast is produced using a cohort-component model. This is a sophisticated demographic accounting system that starts with the most recent decennial census counts by single year of age and gender, survives the age and sex-specific cohorts forward in time, incorporates fertility, mortality and migration trends, and forecasts the total population combining all these inputs. The November 2022 forecast incorporates updated forecast base data, a new forecast horizon, and revisions to the assumptions we used in the 2020 forecast model. Updated base data was only partially released at the time of the forecast. We will revise the base as more data becomes available from the 2020 census.

This document provides annual age and sex-specific population forecasts¹ from 2020-50. The most recent decennial census serves as the population base. The 2022 figures in this report use OFM's April 1 postcensal population estimates and vital statistics data from the Washington State Department of Health. The forecast years are 2023-50.

Fertility: The total fertility rate is at historic lows and we expect that to continue into the future, consistent with national trends. Based on the historical relationship between Washington's Total Fertility Rate and that of the United States, the forecast transitions to a TFR of 1.77 children per woman of childbearing age from the current TFR of 1.61. This is in line with the U.S. Census Bureau's 2017 forecasted trend in fertility (U.S. Census Bureau, 2017). Historically, the increase in women's labor force participation and educational attainment has played a major role in the decline of TFRs over time. Economic factors such as the recent recessions, wage stagnation and student loan debt may also be contributing to delayed childbearing and smaller families. We can see birth delays in the age-specific fertility rates, where rates for 15- to 19-year-old women have dropped dramatically over the past decade.

Recent decreases in fertility rates caused births to decline for the past five years. Between 2021 and 2022, approximately 85,000 births occurred in Washington. This is about 3,000 more than the previous year. As the population grows and the state continues to attract migrants at the working ages (ages 16-64), the number of births is forecast to grow, reaching 94,200 per year by 2035 and 103,800 by 2050. Washington fertility rates are highly influenced by migration, namely the state's Hispanic population and movers from overseas.

Mortality: The state forecast model uses life expectancy at birth to establish rates of mortality for the population. Historically, Washington has higher life expectancy at birth than the United States as a whole, and we expect this trend to continue. Washington's life expectancy is projected using trends for each sex over the past decade. Male life expectancy is projected to continue increasing faster

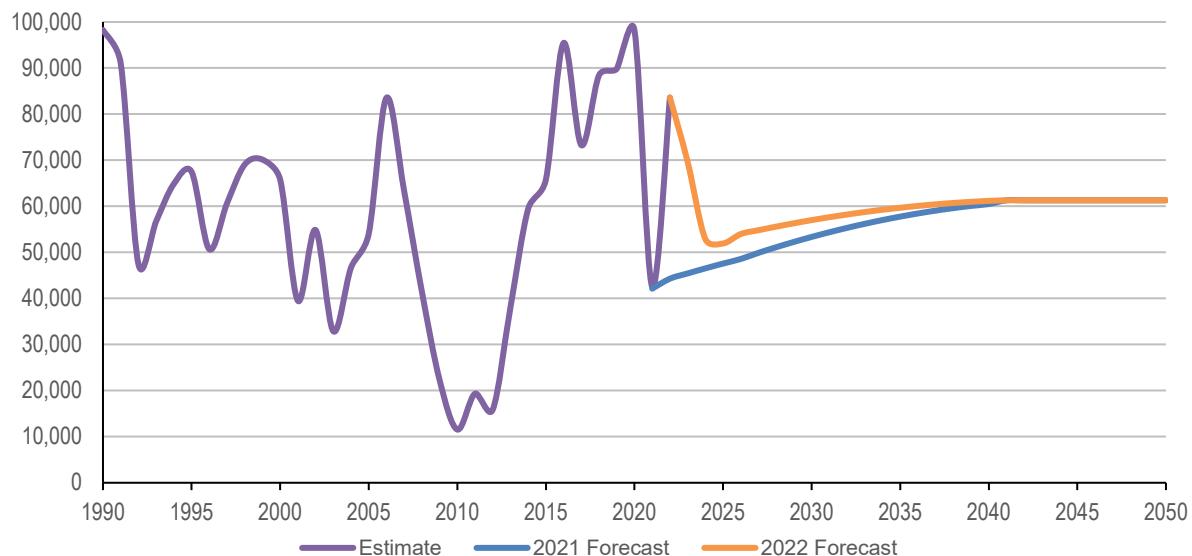

¹ *Population estimates* are figures developed for the current or prior years. Estimates are largely developed from administrative data sets that reflect population change. The assumptions in population estimates generally reflect statistically based and ratio-based relationships between population and indicator data such as housing, tax filers or voters. Thus, estimates are based on actual data and the assumption that previously established relationships will continue. *Population forecasts* are future population expectations. While growth assumptions are usually developed from prior growth trends, the forecast figures are not grounded on actual events and current data. Population forecasts are often developed from forecasts of specific data sets related to population change.

than female life expectancy, rising from 78.5 in 2020 to 84 in 2050, while females are projected to reach a life expectancy of 86.1 in 2050, up from 82.6. To account for near-term deaths due to COVID-19, 2023 life expectancies were reduced by 1.56 years for males and 1.18 for females. While experts have long accepted that females outlive males, the gender gap has narrowed in major developed countries over the past two decades. This is mostly due to lifestyle changes and advances in medicine (Mayhew & Smith, 2012).

Even with increases in life expectancy, deaths are projected to occur at an increasing rate. As Washington's population continues to age, the state will experience higher mortality. Washington's crude death rate is projected to rise from 7.7 deaths per 1,000 people in 2020 to 8.2 in 2030 and 9.9 by 2050.

Net migration: Net migration is an important, but difficult-to-predict component of population change. Although migration typically follows a cyclical pattern related to periods of economic expansion and contraction, some migration – such as military and retiree movement – is not entirely economic. To forecast near-term migration, OFM uses an econometric model that weighs Washington's relative attractiveness to job seekers against California and other states. Near-term migration is then transitioned to a long-term migration average over a period of several years. For the present forecast, we applied a steep, downward adjustment to near-term migration. This accounted for the effects of the pandemic, the economic recession and changes in federal immigration policy.

Figure 1.1: Actual, estimated and predicted net migration, 1990–2050

We present estimated and predicted net migration values in Figure 1.1. The net migration estimate for 2022 is 83,600. That's over 39,300 people higher than last year's forecast. The migration estimate for 2022 is closer to those Washington saw at the end of the last decade. As we transition to a 2020 census-based forecast and add a decade to our forecast horizon, our forecast model relies less on the low migration trends from the 1980's and relies more on the higher recent migration trends of the 2010s. As a result of those model changes, there is higher predicted migration throughout the

forecast period. Our forecast assumes that our current lower level of migration (due to the pandemic and pandemic related unemployment) will slowly increase until 2040 when we will hold the long-term annual migration assumption of 61,300 constant for the rest of the forecast horizon. For the 2025–35 period, net migration is over 37,808 people higher than the previous forecast. Our long-term (30-year) migration assumption for the 2040-2050 period is 12,600 higher than our previous long-term (30-year) migration assumption of 48,700 for the 2030-2040 period last decade.

Part 2: State population change expectations

The components of population change are births, deaths and migration. Natural increase is the number of births minus the number of deaths. Net migration is the difference between in- and out-migration. You can see the dynamic nature of population change in Washington in Figure 2.1, with additional detail in Table 2.1. Between 2020 and 2050, we expect Washington's population to grow by about 2,231,300 people, reaching 9,937,600 in 2050. Approximately 80%(1,788,200 people) of the increase is due to net migration, with the other 20%(443,000 people) due to natural increase.

We expect natural increase to decline from about 26,300 in 2020 to 5,900 by 2050. While births are projected to gradually increase over the forecast horizon, the number of deaths will rise sharply with as the baby boomer generation ages. In the future, state population growth will become more dependent upon migration as natural increase moderates.

Notes: 1) Unrounded data should not be considered accurate to the last digit. 2) Rates computed per 1,000 population at midpoint of time.

3) Totals may not add due to rounding.

Part 3: Age-specific population findings

School-age population

People ages 5 through 17 represent the school-age population in kindergarten through 12th grade. There are an estimated 1,240,800 young people ages 5 to 17 in 2020. The school-age population has been increasing lately after a period of relatively little change the previous decade. We expect this trend to continue, with an average annual gain of approximately 7,000 people per year through 2025, which is when we expect the population to reach 1,275,800. This growth is partly due to the grandchildren of the baby boomer generation reaching school-age (the “third wave” of the baby boom). By 2050, the number of school-age people will be about 1,395,300.

Figure 3.1: Population characteristics ages 5–17

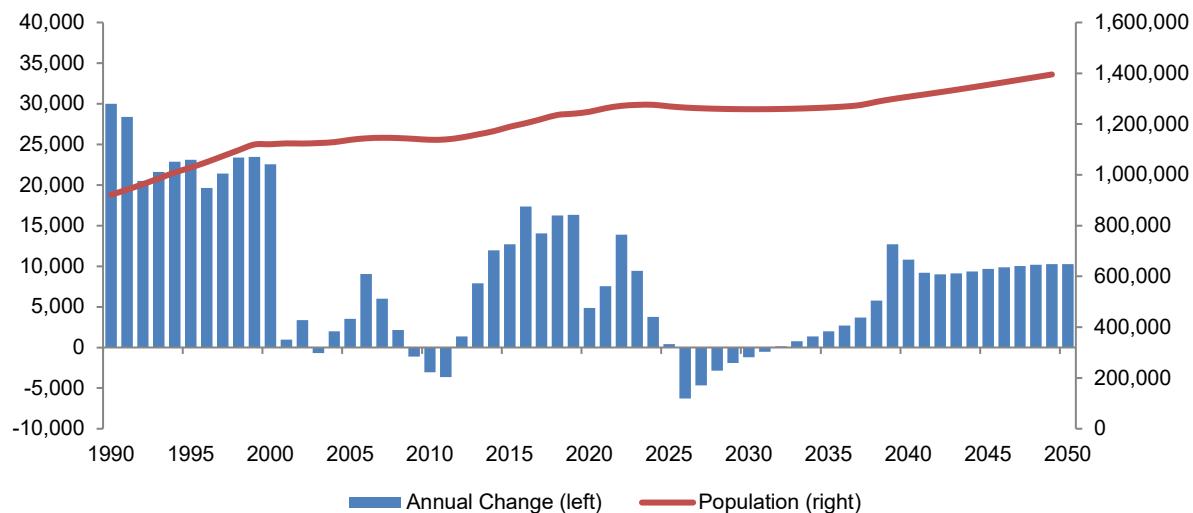

Table 3.1: Population ages 5–17

Year	Year	Year	Year	Year	Year	Year	Year
1990	892,690	2001	1,120,486	2011	1,138,041	2021	1,248,336
1991	921,073	2002	1,123,863	2012	1,139,388	2022	1,262,222
1992	941,571	2003	1,123,183	2013	1,147,300	2023	1,271,662
1993	963,176	2004	1,125,174	2014	1,159,260	2024	1,275,443
1994	986,021	2005	1,128,718	2015	1,171,946	2025	1,275,849
1995	1,009,134	2006	1,137,756	2016	1,189,284	2026	1,269,578
1996	1,028,785	2007	1,143,750	2017	1,203,345	2027	1,264,904
1997	1,050,205	2008	1,145,885	2018	1,219,596	2028	1,262,067
1998	1,073,564	2009	1,144,749	2019	1,235,940	2029	1,260,165
1999	1,097,002	2010	1,141,697	2020	1,240,805	2030	1,258,963
2000	1,119,533					2040	1,298,334
						2050	1,395,285

Note: Departure from trend in 2020 is due to the partial rebasing of the forecast to 2020.

College-age population

People ages 17 through 22 comprise labor force entrants, young workers and the majority of students in postsecondary institutions. There are an estimated 567,000 people ages 17 through 22 in 2020. The number of people in this age group is expected to increase by 6,400 people per year through 2025, when the population will reach 598,800. After 2025, we expect this population to grow by an additional 51,000 people, reaching 649,800 by 2050, with most of the growth between 2025 to 2030 and 2044 to 2050.

2000	494,223					2040	616,317
						2050	649,811

Note: Departure from trend in 2020 is due to the partial rebasing of the forecast to 2020.

Senior population

Washington's population is aging. This major demographic development will have important implications for policymaking and planning at all levels of government. In 2020, there are about 1,253,800 people ages 65 and older. This represents 16% of Washington's total population. By 2050, the elderly population is forecasted to reach 2,299,700. This represents 23% of the state's total population. The highest annual growth will occur between now and 2030. The sharp spike in the 65-and-older population in 2011 corresponds to a similarly sharp spike in births starting in 1946, exactly one year after American service members returned from World War II. These children of 1946 turned 65 in 2011, leading the baby boomer generation into retirement.

Note: Departure from trend in 2020 is due to the partial rebasing of the forecast to 2020.

Most-elderly population

Providing for the long-term care needs of the population ages 85 and older will have important fiscal implications for Washington and the nation. This population, numbering about 132,000 in 2020, is expected to increase by 418,200 people, reaching 550,200 by 2050. Much of this growth will occur after 2030 as the baby boom cohort starts to enter the most-elderly age group, with a 71,200 person increase from 2020–30 and a 347,000 person increase from 2030–50.

Part 5: Annual population estimates and forecasts, 2020–50

The following tables present annual population estimates and forecasts by age and sex for the years 2020–50. Figures for 2020 reflect 2010-based data controlled to newly released Census 2020 totals by age. Figures for years 2022 represent OFM's postcensal estimates. The forecast years are 2023–50.
